

SQL Server AVG() Function

javatpoint.com/sql-server-avg-function

SQL Server AVG() function is used to return the average value of an expression.

Syntax:

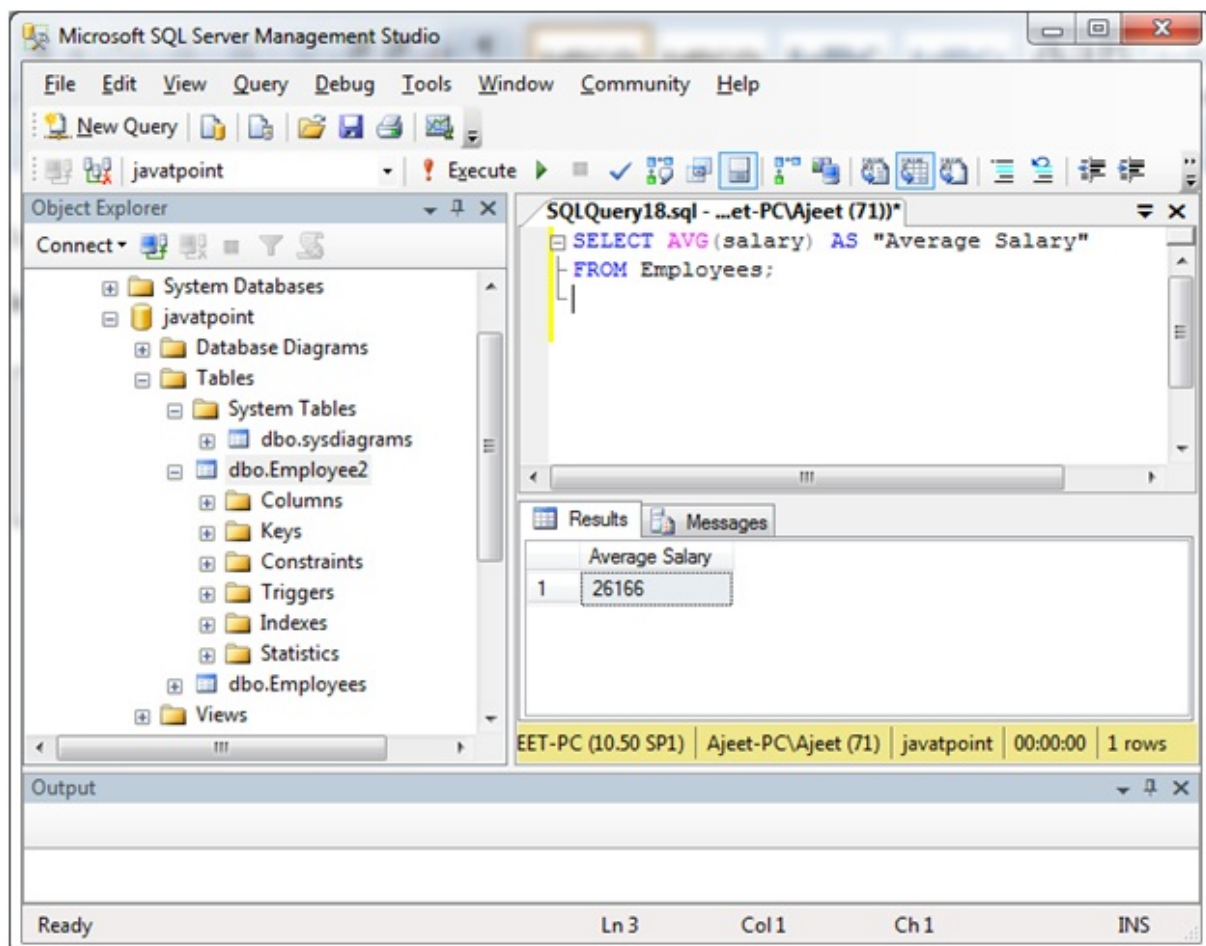

1. SELECT AVG(aggregate_expression)
2. FROM tables
3. [WHERE conditions];

Example:

Select "Employees" table and fetch the average salary of the table.

1. SELECT AVG(salary) AS "Average Salary"
2. FROM Employees;

Output:

The screenshot displays the Microsoft SQL Server Management Studio interface. The 'Object Explorer' on the left shows the 'javatpoint' database with its tables, including 'dbo.Employee2'. The 'SQLQuery18.sql' window in the center contains the following query:

```
SELECT AVG(salary) AS "Average Salary"
FROM Employees;
```

The 'Results' pane at the bottom shows the output of the query:

	Average Salary
1	26166

The status bar at the bottom indicates the query was executed successfully, showing '1 rows'.
